

## Successful management of a wee newborn with a major anomaly!

With immense pleasure I would like to announce that we have successfully treated a newborn with an enormous cyst in the abdomen through laparoscopic surgery (Key hole surgery).

Six day old newborn with a mere weight of 1.80 kg had a large Choledochal Cyst (cyst arising from biliary tract). We successfully excised the cyst through laparoscopy. Advantage of this approach is expeditious recovery and excellent cosmetic result. A large abdominal scar was avoided. I would like to thank **Dr Gurusev** for valuable support during the procedure, **Dr Dilip Chavan** for precise anesthesia and **Dr Anand Bedekar** for post operative neonatal care.

This is probably the youngest and the tiniest newborn to be managed complex and supra major surgery through laparoscopy.
